

What needs to be done:

1. Draw the hangman. A *DrawingArea* can be used.
2. A file with a word list needs to be read. For example:  
<https://www.archlinux.org/packages/community/any/words/>
3. A word from it must be selected randomly.
4. It needs to be shown with gaps, e.g. as a *Label* or in a *DrawingArea* using Pango.
5. User input must be processed. An *IMMulticontext* may help.
